

The ICAO Space Weather Information Service

Space Weather (SWX) and Aviation:

What is SWX? The Sun drives our planet's weather and climate patterns and is the main driver for space weather. SWX relates to the dynamic processes on the Sun which affect the interplanetary space and can impact various technological systems as well as human well-being on Earth.

Impacts on Aviation: SWX effects can impact GNSS, positioning and navigation, deteriorate and limit radio communications, or cause an increased radiation exposure at certain flight altitudes^{4,5}.

ICAO SWX Information Service*: The goal is to advise aviation users when SWX events are expected to cause a moderate or severe impact related to the deterioration or loss of satellite navigation or HF communication (long-distance radio) or enhanced radiation dose at specific flight levels. Advisories are disseminated through ICAO's standard communication channels⁶ and are required for completeness of flight documentation.

SWX Advisories definitions:

- ★ Similar in structure to volcanic ash and tropical cyclone advisories.
- ★ Advisory triggers and relevant thresholds are defined in the Manual on Space Weather Information in Support of International Air Navigation, ICAO Doc 10100¹; detailed service specification including advisory format, and upcoming changes are provided in Annex 3² and PANS-MET (Doc 10157)³.
- ★ Spatial range of SWX Advisory can vary largely from isolated sectors to large areas on Earth.
- ★ Duration of a SWX impact can range from tens of minutes to several days.
- ★ Impacted areas are given in terms of polygons with maximum 6 corners (7 points) based on geographic coordinates with resolution of 5° in latitude and longitude; alternatively, one or more pre-defined latitude bands may be used varying by 30° (e.g. HNH, MNH, EQN) and a longitude range with 5° increments.

SWX Advisories in a nutshell:

- ★ **Start:** Resilient 24/7 staffed operations since November 2019.
- ★ **Service:** Near-real-time ICAO advisories issued by 4 global SWX centers supported by 1 regional center.
- ★ **Impact:** Cover domains of navigation (GNSS), radiation exposure (RAD) and radio communications (HF COM).
- ★ **Standards:** Impact-based advisory thresholds tailored to ICAO standards.
- ★ **Updates:** Within 6 hours from start of event.
- ★ **Severity levels:** MOD or SEV
- ★ **NOTE:** SIGMETs and NOTAMs are not issued based on SWX Advisories

Global Navigation Satellite System (GNSS):

Ionosphere's Role: The ionosphere, a top layer in our atmosphere ionized by sunlight, affects satellite navigation signals.

Signal Disruption: Solar storms can cause ionospheric disturbances, altering GNSS signal strength, velocity and phase.

Scintillation: This rapid change can prevent receivers from locking onto signals, making it hard to determine position.

Vertical Total Electron Content: Increased VTEC in the ionosphere during solar storms can cause positioning errors in satellite navigation.

Advisory Severity Levels: GNSS **MOD**; GNSS **SEV**

Increased radiation dose at flight levels (RAD):

Energetic Particles: During solar storm events, high-energy solar particles like protons can be rapidly accelerated and travel towards Earth.

Radiation Increase: Once energetic particles reach Earth, they can penetrate the atmosphere, especially close to the magnetic poles, creating a shower of particles, possibly reaching the ground.

Impact on Flights: This can affect crew and passengers by exposing them to increased levels of ionizing radiation, especially at high altitudes and polar routes.

Advisory Severity Levels: RADIATION **MOD**; RADIATION **SEV**

***Note:** MOD RAD advisories will only be issued at and below FL460.

MOD and SEV areas can be reported in one advisory

HF Communication (HF COM):

HF Radio Waves: These waves (3-30 MHz) are used for long-distance communication, especially important for polar and transatlantic flights.

Ionosphere's Role: The ionosphere reflects HF radio waves, enabling communication beyond the horizon by bouncing signals between the Earth and the ionosphere.

Impact of Solar Storms: Events like solar flares and coronal mass ejections add extra energy to the ionosphere, highly disturbing it.

Communication Disruption: This extra energy can cause unexpected absorption or reflection of HF radio waves, leading to communication failures.

Affected Areas: Disruptions can occur near the poles, on the sunlit side of the Earth or even affect the entire globe, depending on the type and severity of the solar storm.

MUF Reduction: Ionospheric changes after geomagnetic storms can significantly lower the maximum usable frequency (MUF) for HF communication, affecting any location on Earth.

Advisory Severity Levels: HF COM MOD; HF COM SEV

Dissemination of SWX Advisories via AFS*

- ★ Advisories are disseminated in TAC and IWXXM formats with different WMO headers⁶.
- ★ SWX advisories for different domains (GNSS, HF COM, RAD) have different WMO headers.
- ★ Every global SWX center has a WMO 4-letter identifier.

01 = GNSS
02 = HF COM
03 = RADIATION

Space Weather Information Service Provision Centers:

Four global centers (PECASUS, ACFJ, SWPC and CRC) provide ICAO SWX services, switching responsibility roles every two weeks. The global centers are supported by a regional center (SANSa) which continuously supports the "On Duty" center with additional datasets and models.

Upcoming changes to the SWX Advisories:

- ★ 7-points polygon implementations
- ★ L-shaped or arbitrary shaped polygons

Changes coming in Nov 2027:

- ★ Forecast fields change from +6h, +12h, +18h and + 24h to +3h, +6h, +9h and +12h (effective Nov 2027).
- ★ Flight levels resolution for RAD advisories changes from 1000 ft to 5000 ft.

Have a safe flight!

Read more:

*Space weather information service (SWIS) is a globally coordinated service where space weather centres provide information on space weather phenomena that may affect communications, navigation and surveillance systems and/or pose a radiation risk to aircraft occupants.
*AFS stands for Aeronautical Fixed Service and ATN refers to Aeronautical Telecommunication Network
